The Fixed Index Annuity

A New Core for Retirement Saving?

With a challenging market expected ahead, the classic 60/40 stock/bond strategy may struggle to build wealth and fund retirement spending for investors. Allocating some traditional core bond exposure to a fixed index annuity could change the game.

JUNE 2026

Richard A. Brink, CFA
Market Strategist—US Retail Group

Executive Summary: The Big Picture

For four decades, investors have enjoyed strong market returns. For the first two decades, returns were largely driven by fundamental tailwinds; over the past two decades, it was multiple rounds of stimulus to provide support during a series of crises. But this stimulus also “borrowed” future return potential. Over the past few years, a series of shocks has kept inflation and interest rates higher. Returns could get a boost when rates eventually fall, but future years could see meaningfully lower return potential and higher structural inflation.

It's important for savers to use every tool at their disposal to build up their retirement accounts and—ultimately—improve potential retirement outcomes. These tools include enhancing the return path, or sequence of portfolio returns, through better up/down capture. That means participating meaningfully in rising markets (up capture) while reducing losses in down markets (down capture). In our view, it comes down to “participate and defend.”

An array of investments and investment structures may improve a portfolio's path—its volatility relative to the market's. Annuities are one example that may enhance portfolios in this way. For example, the fixed index annuity's structure, substituted for part of a traditional core bond allocation, helped retirement savers build more assets in nearly two-thirds of our scenarios.

And with the addition of an optional guaranteed lifetime income benefit, the 60/40 portfolio with the integrated fixed index annuity may also improve retirement income. It beat the traditional 60/40 nearly 95% of the time, with an average of 8.8% more income in winning periods (see page 5 for details).

Based on our research, substituting a fixed index annuity for part of the core fixed-income allocation could help consumers build more assets during their working years. What's more, for people who prioritize retirement income, attaching a lifetime income option to the fixed index annuity may improve spending rates in retirement.

The Classic 60/40 Portfolio

“Buy low, sell high.” “The trend is your friend.” “Don't stay on the sidelines.” Those axioms seem as old as the markets, and so does the classic balanced stock/bond portfolio. The 60/40 has probably been the most popular mix: 60% stocks and 40% bonds. Historically, stocks have delivered capital growth, while bonds have provided income and diversification—a critical feature when equity markets tumble.

The 60/40 portfolio has been a staple for decades, providing solid-to-strong total returns with moderate risk. There have been down markets along the way, but since the beginning of the Reagan administration in January 1981, a simple mix of 60% S&P 500 and 40% Bloomberg US Aggregate Bond Index has delivered an annualized total return of 10%, with 9.7% annualized risk (*Display 1*).

When Will the Era of External Inflation Shocks End?

Strong returns have been increasingly driven not by fundamental forces but by growing debt, ever-expanding valuation multiples and, later, policy intervention in crises such as the global financial crisis and COVID-19 pandemic. Historic Fed policy action and fiscal stimulus saved the US economy but also reawakened inflation. Like “unintended links in a chain,” the series of inflation shocks continued, including the Ukraine war, 2025 tariff turmoil and the Iran conflict. The result? Inflation has stayed up and rates are at levels not seen in years.

Investors have been “waiting for Godot” in the meantime—waiting for the last inflation shock to pass through—bringing inflation rates and yields down. Until then, return potential may be substantial and could be boosted when interest rates decline. On the other side, we expect lower growth, structurally higher inflation, lower returns (*Display 2*) and more volatility. And, critically, policy support has cushioned against downturns for 20 years—can investors expect that to continue?

For individuals investing to fund 30 years or possibly more of retirement income, we think it makes sense to take advantage now, before a lower-return environment creates a stiffer challenge for long-term savers.

The Sequence of Portfolio Returns Matters

Such an environment would be hard for any investor to navigate, but the risks are magnified for those close to or in retirement.

For pre-retirees who are building assets and won't need to make cash withdrawals for many years, the chronological order of returns doesn't matter so much. If markets sell off, the playbook says to hang on, keep investing work income in cheaper assets and ride out the downturn until the market rebounds.

The math is different for retirees, making the sequence of portfolio returns critical. Not only have their paychecks dried up, but they're also starting to withdraw money from their accounts to fund their lifestyles. If equity markets fall just before or early in retirement, those withdrawals remove assets that would otherwise help rebuild accounts as markets recover.

Not only do retirees no longer have incoming paychecks, but they're also starting to pull money out of their accounts to fund income needs in their post-working years. If equity markets decline early in retirement, portfolio withdrawals remove some of the assets that can help a retirement account rebuild as markets recover. This scenario, which seems all too real given the experience in 2022, could increase the odds of running out of money in retirement.

The Retirement Income Challenge—Magnified

Based on a common rule of thumb, retirees with 60/40 portfolios should be able to withdraw 4% from their accounts annually over a 30-year retirement period and have fairly good chances of making it all the way through retirement without running out of money.

That rule may have made sense when a classic 60/40 portfolio was producing annualized returns over 10%, enabling retirees to make 4% withdrawals while leaving a cushion in case of an ill-timed bad market. But we believe that investors will eventually face lower returns and higher volatility, so the cushion will be much smaller.

Given the high stakes in retirement saving, it's more important than ever for savers to use every tool at their disposal to build up their retirement accounts and—ultimately—improve potential retirement outcomes.

Building a Better Path Through Portfolio Design

Those tools include building a better return path: if unfavorable return sequences can hurt retirement savings, it may make sense to design a portfolio that can improve that sequence.

Building a better path really comes down to creating an asset allocation that improves a portfolio's up/down capture—in other words, the balance between how much a portfolio participates in rising markets and how much it loses in down markets. Even a modest improvement in a portfolio's up/down capture may make a big difference in the return path. Think of it as building a better beta.

For example, a portfolio that captures 90% of rising equity markets (aka a 90% up capture) and 80% of falling markets (an 80% down capture) doesn't seem radically different from the returns of the broad markets. But it has the potential to largely keep pace with the S&P 500 in strong markets and may actually outperform it over the long run—helped by its design to lose less than the market.

When it comes to portfolio construction, people have many choices as they seek better betas. Among them are diversifying bond exposure with additional income-generating securities and substituting high-yield bonds for some part of a portfolio's equity exposure. Another example of better beta may be focusing on quality stocks rather than tracking a broad equity index.

Annuities as Better Betas

In addition to creating betas that are improved because of the nature of the investment itself, retirement savers may have another tool at their disposal: a better beta that results from explicit structure. Annuities, for example, are designed in a way that may allow them to improve on broad market exposures.

Among the annuity choices for savers is the fixed index annuity, which offers return potential above that of high-quality core bond strategies without any downside risk. What is a fixed index annuity? It's a long-term financial product designed for retirement that combines tax-deferred growth potential, principal protection and the opportunity for lifetime income, backed by the claims-paying ability of the issuing insurance company. The interest earned is based on the performance of an underlying index, such as the S&P 500 or MSCI EAFE Index. Insurance companies may use price return indices, which exclude dividend earnings.

Depending on the account chosen, interest may be capped at a maximum rate or adjusted by a certain percentage set by the annuity issuer. Since assets aren't invested directly in an index, the value of the fixed index annuity isn't affected by market downturns, and consumers will never lose principal or the interest they earn, but if the market return is negative the interest rate is 0%. For savers concerned about outliving their retirement income, there's also the option in many fixed index annuities to elect a guaranteed lifetime income rider that ensures payments for life—even if the account value is depleted.

The fixed index annuity's structure provides steady income payments and the ability to diversify a portfolio, which may help reduce the impact of equity downturns. It gives savers another avenue to improve portfolio up/down capture, with principal protection and the opportunity for tax-deferred growth.

Fixed index annuities are becoming more popular among those seeking to build assets for retirement and enhance their retirement income. Annuities should be considered a long-term proposition: while savers are building wealth, they should be prepared to rely on current income sources and other portfolio assets to fund potential near-term liquidity needs. This will also avoid charges on premature withdrawals—tax penalties for annuity withdrawals before age 59½.

Because annuities may deliver better betas, we think there's a strong case for integrating them alongside stocks and bonds—including using the fixed index annuity to augment traditional core bonds. These annuities offer compelling payout structures today that last for the life of the contract—possibly five years or more. Bond yields will likely fall eventually, and while cap rates would also come down over time, too, they've tended to be somewhat "stickier" than underlying interest rates and less volatile. In our view, this sets up an opportunity to explore integrating annuities into balanced portfolios.

Road Testing a New Core Allocation

Let’s take a closer look at whether the fixed index annuity, substituted for some part of a core fixed-income portfolio allocation, can improve outcomes during the retirement accumulation phase. We’ll also assess whether a fixed index annuity with an optional guaranteed lifetime income rider can improve retirement income results. Let’s start by comparing two portfolios. The first is the highly popular 60/40 mix—in this case, 60% S&P 500 and 40% Bloomberg US Aggregate Bond Index. The second portfolio enhances that mix by shifting half the bond allocation into a fixed index annuity. The resulting allocation for the Fixed Index Annuity (FIA) Enhanced Portfolio is 60% S&P 500, 20% Bloomberg US Aggregate Bond Index and 20% fixed index annuity.

Based on 10-year return forecasts starting December 31, 2025, the mean annual return for stocks will be 5.8%, and for bonds 4.7% (*Display 3*). The fixed index annuity we’ll integrate is based on the price return of the S&P 500, with associated fees and cap rates (*Display 4*). Fixed index annuity providers also offer custom multi-asset indices, created by leading banks and asset managers, with unique features that often produce attractive rates. For this analysis, we’ll use the S&P 500 because it’s broadly popular and more straightforward to model.

Accumulation: The Fixed Index Annuity Drives Better Savings

The first evaluation we’ll make is in the accumulation phase, testing to better understand whether the fixed index annuity allocation can do a better job of building wealth. Specifically, we’re looking to answer three questions about the FIA Enhanced Portfolio:

1. Is it likely to accumulate more assets than the 60/40?
2. When it wins, is the margin bigger than the losing margin when it falls short of the 60/40?
3. Does it fare better in the extremes (the 90th and 10th outcome percentiles)?

DISPLAY 4: FIXED INDEX ANNUITY—PRODUCT ASSUMPTIONS

Percent

Underlying index for fixed index annuity example is the S&P 500
As of December 31, 2025

Source: JourneyGuide, S&P and AB

To answer these questions, we deployed a retirement-planning software tool, JourneyGuide. JourneyGuide can run thousands of simulations to assess the effectiveness of underlying indices for various annuity products. For our analysis, JourneyGuide ran 5,000 simulations of future returns over a 10-year period starting December 31, 2025, and evaluated the resulting return distributions. Over a 10-year accumulation period (*Display 5, page 4*), the FIA Enhanced Portfolio built more wealth than did the 60/40 in 64% of the simulations. What’s more, the FIA Enhanced strategy won by a bigger margin on average. When the FIA Enhanced won, it averaged a 6.1% winning margin; when the 60/40 won, it was by a much lower 3.7%. That’s called a favorable return skew—the FIA Enhanced won bigger than it lost. For a \$1 million portfolio evaluated across 5,000 simulations, the average advantage worked out to equal \$56,548 over 10 years.

Since averages can be deceiving, it’s important to dig a little deeper into the magnitude of the differences among the outcomes. For example, when the differences in total 10-year wealth accumulations were the biggest, how much better or worse were the outcomes from each portfolio (*Display 6, page 4*)? Based on the simulations, when the FIA Enhanced Portfolio accumulated more in the extreme (represented by the 10th percentile of winning margins), it won by more than 10% over the 60/40. Conversely, when the FIA Enhanced lost to the 60/40 portfolio by a large margin (represented by the 90th percentile), it lost by a much smaller margin of –5.01%.

So, based on the evidence, the FIA Enhanced Portfolio provides a better experience in the extremes during the accumulation phase too.

The combination of traditional core bonds and the fixed index annuity in the FIA Enhanced Portfolio might also help retirement savers keep pace with inflation if it rises in the years ahead. Core bonds can be reinvested at higher rates as yields rise, and the fixed index annuity offers the opportunity for account growth as the underlying index increases in value.

The Income Phase: More Retirement Spending with Guaranteed Income

At some point, every saver moves out of the wealth-building phase and into the income phase, starting to tap into their accumulated wealth to fund their spending needs beyond their working years. In this chapter of life, income is the desired outcome.

To understand how the FIA Enhanced Portfolio performs during this period, we used the JourneyGuide simulation but extended the time horizon to 40 years: the 10 years of accumulation already modeled, followed by another 30 years withdrawing income in retirement. We used the same two portfolios: the 60/40 and FIA Enhanced. But this time, the FIA Enhanced Portfolio carried an optional guaranteed lifetime income rider, with the associated fee as well as a reduced cap rate.

To gauge whether the FIA Enhanced Portfolio with a lifetime income benefit improves retirement income, we zeroed in on two questions:

1. Which portfolio provides better chances of being able to spend more in retirement?
2. Which portfolio delivers more income at what we'll call a "safe-spending 90th percentile"?

The primary goal of an FIA with the inclusion of a lifetime income benefit is to enhance retirement spending power. And the FIA Enhanced Portfolio with lifetime income delivered on that score—beating the 60/40 a whopping 94.92% of the time, with an average winning income margin of 8.80% when it topped the 60/40 (*Display 7, page 5*).

That's significantly more income to support retirement living!

DISPLAY 7: FIA ENHANCED PORTFOLIO WITH INCOME RIDER ENHANCES RETIREMENT SPENDING VS. 60/40 PORTFOLIO

FIA Enhanced Portfolio Performance Margin by Percentile

90%	75%	50%	25%	10%	Frequency of FIA Enhanced Outperformance vs. 60/40	Average Losing Margin	Average Winning Margin
1.36%	4.02%	7.35%	11.27%	16.29%	94.92%	1.38%	8.80%

Past performance does not guarantee future results. See hypothetical disclosure on page 6.

The 60/40 Portfolio represents a blend of the total returns of 60% S&P 500 and 40% Bloomberg US Aggregate Bond Index. Price returns would be lower. The FIA Enhanced Portfolio represents 60% S&P 500 total return, 20% Bloomberg US Aggregate Bond Index total return and 20% fixed index annuity return based on the S&P 500 price return. Annuity includes optional guaranteed lifetime income rider, including the associated fee and reduced cap rate. Taxes are omitted from the accumulation phase, as assets are assumed to be held within qualified retirement vehicles. Annuity and portfolio withdrawals (accounting for required minimum distributions) are taxed at ordinary income tax rates for individuals, increase with inflation and incorporate the sunset of the Tax Cuts and Jobs Act in 2025. Standard deductions are assumed, as are state income taxes (using Indiana as an example). Based on return distributions from 5,000 simulations of future returns from JourneyGuide retirement-planning software over a 10-year period starting December 31, 2022, followed by an additional 30 years of retirement income withdrawals.

As of December 31, 2025

Source: Bloomberg, JourneyGuide, S&P and AB

Averages are important, of course, but markets don't deliver their average returns every single year. To gain more confidence in how a comfortable retirement is achieved, we needed to understand the distribution of potential retirement-spending outcomes. That's where the concept of a safe-spending rate comes in—specifically, a safe-spending 90th percentile.

In other words, how much could a retiree spend annually from his or her portfolio while maintaining a 90% probability of not running out of money? For the 60/40, this spending value was \$28,252; for the FIA Enhanced Portfolio with rider, it was \$32,118. That's an extra 13.6% in annual retirement spending by choosing the FIA Enhanced Portfolio with lifetime income rider—a big difference (*Display 8*). To

maximize the impact of the income rider, retirees should avoid excess withdrawals that could decrease income payments.

Summing It All Up: A New Core Allocation

For four decades, a traditional 60/40 stock/bond strategy delivered strong results and helped retirement savers achieve their wealth-building and retirement-spending goals.

Based on our research, substituting a fixed index annuity for part of the core fixed-income allocation may help consumers accumulate more assets during their working years. What's more, for those people who prioritize retirement income, attaching a lifetime income option to that annuity may improve spending rates in retirement, both on average and at the 90% confidence level.

DISPLAY 8: KEY QUESTIONS—DISTRIBUTION

Extra 13% Increase in Annual Retirement Spending by Choosing the FIA Enhanced Portfolio with Rider

Past performance does not guarantee future results.

The 60/40 Portfolio represents a blend of the total returns of 60% US large-cap stocks and 40% US core bonds. Price returns would be lower. The FIA Enhanced Portfolio represents 60% S&P 500 total return, 20% Bloomberg US Aggregate Bond Index total return and 20% fixed index annuity return based on the S&P 500 Index price return, with an index rate cap of 5% and an annual fee of 1%. Taxes are omitted, as assets are assumed to be held within qualified retirement vehicles. Based on distributions from 5,000 simulations of future returns provided by JourneyGuide retirement-planning software over a 40-year period starting December 31, 2022. The FIA Enhanced Portfolio is hypothetical and does not represent an actual portfolio or annuity contract. Results will vary.

Index annuities are not a direct investment in the stock market. They are long-term insurance products with guarantees backed by the claims-paying ability of the issuing insurance company. They provide the potential for interest to be credited based in part on the performance of the specified index, without the risk of loss of premium due to market downturns or fluctuations. Index annuities may not be appropriate for all individuals.

Withdrawals may be subject to withdrawal charges and federal and/or state income taxes. An additional 10% federal tax may apply if you make withdrawals or surrender your annuity before age 59½. Please consult your tax advisor regarding your specific situation.

All contract and benefit guarantees, including any fixed account crediting rates or annuity rates, are backed by the claims-paying ability of the issuing insurance company. They are not backed by the broker/dealer from which this annuity is purchased. There is no guarantee that any projection, forecast or opinion in this material will be realized. Past performance does not guarantee future results.

Simulated or hypothetical performance results have certain inherent limitations. Unlike the results shown in an actual performance record, these results do not represent actual trading. Results include estimates of trading costs and market impact; however, because these trades have not actually been executed, results may have under- or overcompensated for these costs.

Simulated or hypothetical trading programs in general are also subject to the fact that they are designed with the benefit of hindsight. No representation is being made that any account will or is likely to achieve returns or a volatility profile similar to those being shown.
